**Figure S2.** Attachment by wild-type *P. aeruginosa* PAO1 in response to increasing concentrations of (A) glucose-6-phosphate or (B) β-methyl galactoside. Attachment assays were carried out in LB alone or supplemented with glucose-6-phosphate or β-methyl galactoside at the concentrations indicated, with attachment assessed using CV staining. Experiments were carried out in duplicate using at least 8 technical replicates each. Error bars indicate standard deviation. ***, statistical significant difference relative to LB alone (**p-value< 0.05).
